Here is a comprehensive breakdown of the project:

What is DevOnboard?

DevOnboard is a MERN-stack **onboarding copilot** built for the IBM Bob 2.0 hackathon. Its goal is to automate and guide new engineers through repository setup — turning a weeks-long manual process into a structured, automated dashboard experience.

The app has two user roles:

- **Manager** — configures the onboarding workflow (add/edit/reorder/delete tasks)
- **Engineer** — follows the guided setup checklist to get their environment running

what features should I focus on next that completes the proof of concept of the project

Let me look at the actual state of the placeholder pages before making recommendations.

summarize the prompts that have been sent in this session

Here is a chronological summary of every prompt sent in this session:

Session Prompt Summary

1. Project Overview

"what is the purpose of the project, what is missing, in the end provide a summary and conclusion"

Explored the full repository. Reported that DevOnboard is a MERN-stack onboarding copilot with JWT auth, task CRUD, and a React dashboard. Found 4 of 7 pages were visual placeholders with no real data.

2. PoC Feature Prioritisation (First Pass)

"what features should I focus on next that completes the proof of concept of the project"

Recommended 4 priorities: (1) wire the Setup Checklist to real task execution via a new server endpoint, (2) make the Environment Validator real using the same endpoint, (3) complete the Onboarding Completion screen, (4) fix the DocumentationQA search bug.

3. Setup Checklist Breakdown

"break down the Setup Checklist proof of concept into simpler subtasks"

Broke the Setup Checklist into 6 subtasks: server endpoint, API helper, Task interface extension, replace `runNext()`, render check output, live Host Diagnostics sidebar.

4. Setup Checklist — Subtask 1

"do subtask 1 for setup checklist and verify"

Added `POST /api/tasks/:id/run` to `server/src/routes.ts` using Node's `child_process.exec`. Verified with `tsc --noEmit` — clean.

5. Setup Checklist — Subtasks 2 & 3

"do subtask #2 and #3 for setup checklist then verify"

Added `CheckResult` interface and `runTaskCheck()` to `api.ts`. Extended `Task` interface in `SetupChecklist.tsx` with `checkOutput` and `checkPassed` fields. Verified clean.

6. Setup Checklist — Subtask 4

"do subtask #4 for setup checklist then verify"

Replaced the local `runNext()` state flip with a real `async` function calling `runTaskCheck()`. Added `running` state, button spinner, auto-advance effect. Verified clean.

7. Setup Checklist — Subtasks 5 & 6

"do subtask #5 and #6 then verify"

Rendered real check output in a `Terminal` block per task card. Replaced hardcoded Host Diagnostics sidebar with live `Promise.allSettled` probes of the first 3 tasks. Verified clean.

8. How to Validate Setup Checklist

"how do I validate in the manager view of the webpage the setupchecklist? Does features even work in the 'New Hire' view"

Clarified there is no manager view of `/setup` — both roles see the same page. Provided a step-by-step test guide covering task loading, run button, real output terminal, pass/fail status, auto-advance, and the Manager Settings → engineer validation loop.

9. Environment Validator Breakdown

"breakdown environment validator into simpler subtasks"

Broke it into 5 subtasks: `runAllChecks()` helper, replace `INITIAL_GROUPS` with real fetch, wire Re-run, wire Auto-Fix with re-check, real Host Machine sidebar via `/api/system`.

10. Environment Validator — Subtask 1

"do subtask #1 for Environment Validator"

Added `CheckSummary` interface and `runAllChecks()` to `api.ts`. Verified clean.

11. Environment Validator — Subtasks 2 & 3

"do subtask #2 and #3 for Environment Validator"

Removed `INITIAL_GROUPS`, added `TAG_GROUP` map and `summariesToGroups()`, added `fetchAndApply()` with real `runAllChecks()` call on mount. Replaced fake `setTimeout` in `handleRerun` with real fetch. Added loading spinner and fail-count display. Verified clean.

12. Environment Validator — Subtasks 4 & 5

"do subtask #4 then subtask #5 for Environment Validator"

Made `handleAutoFix` async with optimistic UI and real `runTaskCheck` re-check. Added `GET /api/system` endpoint using Node's `os` module. Added `SystemInfo` type and `getSystemInfo()` to `api.ts`. Replaced hardcoded Host Machine sidebar with real server data. Verified both packages clean.

13. How to Validate Environment Validator

"how will I test the environment validator in Manager view and New Hire view"

Clarified again there is no separate Manager view — `/validator` is the same for both roles. Provided full test matrix covering load behaviour, real pass/fail display, Re-run, Export JSON, Auto-fix, and the Manager Settings → validator validation loop.

14. PoC Feature Prioritisation (Second Pass)

"what features should I focus on next that completes the proof of concept of the project"

Re-evaluated after completed work. Identified 3 remaining items: (1) fix DocumentationQA search — one-line bug, (2) wire Onboarding Completion readiness ring using `runAllChecks()`, (3) CommitHistory "Fetch Remote" button — cosmetic fix. Assessed the project as 85% complete.

15. Session Summary (this prompt)
